# General Description

The 74HC139 is identical in pinout to the LS139. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs.

This device consists of two independent 1–of–4 decoders, each of which decodes a two–bit Address to one–of–four active–low outputs. Active–low Selects are provided to facilitate the demultiplexing and cascading functions. The demultiplexing function is accomplished by using the Address inputs to select the desired device output, and utilizing the Select as a data input.
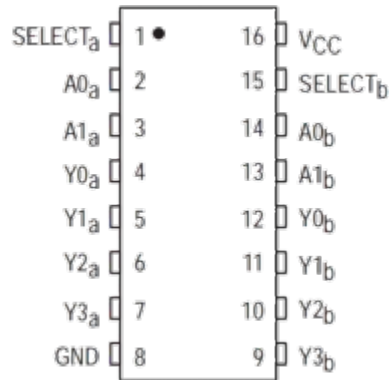

Features

➢ Output Drive Capability: 10 LSTTL Loads

➢ Outputs Directly Interface to CMOS, NMOS and TTL

➢ Operating Voltage Range: 2.0 to 5.0 V

➢ High Noise Immunity Characteristic of CMOS Devices

➢ In Compliance with the Requirements Defined by JEDEC Standard No. 7A
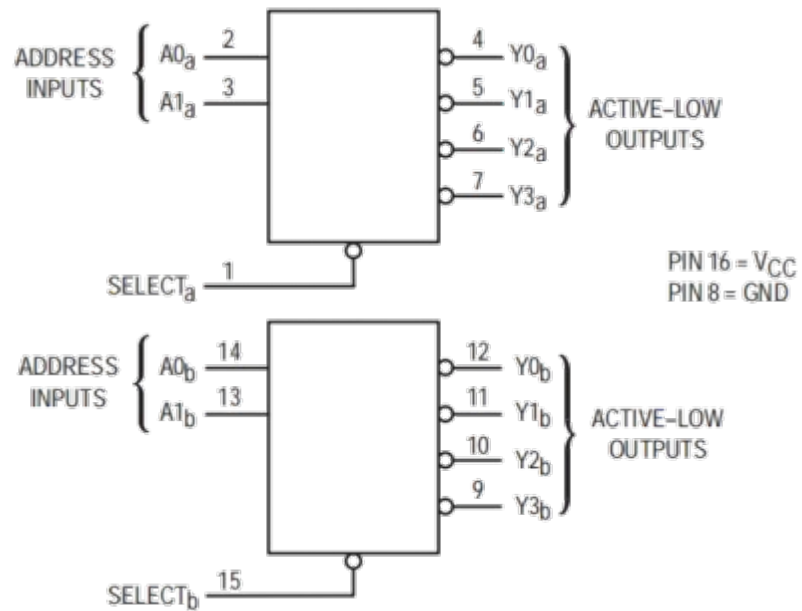

➢ Chip Complexity: 100 FETs or 25 Equivalent Gates

Pin Descriptions

ADDRESS INPUTS

A0a, A1a, A0b, A1b (Pins 2, 3, 14, 13)

Address inputs. These inputs, when the respective 1–of–4 decoder is enabled, determine which of its four active–low outputs is selected.

CONTROL INPUTS

Selecta, Selectb (Pins 1, 15)

Active–low select inputs. For a low level on this input, the outputs for that particular decoder follow the Address inputs. A high level on this input forces all outputs to a high level.
OUTPUTS

Y0a – Y3a, Y0b – Y3b (Pins 4 – 7, 12, 11, 10, 9)

Active–low outputs. These outputs assume a low level when addressed and the appropriate Select input is active. These outputs remain high when not addressed or the appropriate Select input is inactive.
