TERMS AND DEFINITIONS

V_{sat} – Saturation voltage of the output switch.

V_F – Forward voltage drop of the output rectifier.

The following power supply characteristics must be chosen:

V_{in} – Nominal input voltage.

V_{out} – Desired output voltage, $|V_{out}| = 1.25 \left(1 + \frac{R_2}{R_1}\right)$

f_{min} – Minimum desired output switching frequency at the selected values of V_{in} and I_{out}.

V_{ripple(p-p)} – Desired peak-to-peak output ripple voltage. In practice, the calculated capacitor value will need to be increased due to its equivalent series resistance and board layout. The ripple voltage should be kept to a low value since it will directly affect the line and load regulation.
